

Quantizing neural networks

Efficient Deep Learning - Session 2

IMT Atlantique
Bretagne-Pays de la Loire
École Mines-Télécom

Sessions

- 1 Deep Learning and Transfer Learning,
- 2 Quantization,
- 3 Pruning,
- 4 Factorization,
- 5 Distillation,
- 6 Operators and Architectures,
- 7 Embedded Software and Hardware for DL.
- 8 Presentations for challenge.

Sessions

- 1 Deep Learning and Transfer Learning,
- 2 Quantization,
- 3 Pruning,
- 4 Factorization,
- 5 Distillation,
- 6 Operators and Architectures,
- 7 Embedded Software and Hardware for DL.
- 8 Presentations for challenge.

Today's Summary

1 Objectives

2 Quantization : Basics

- Floating Point
- Integers, Fixed Point
- Quantization

3 Quantization : Neural Networks

- Quantization Post Training
- Quantization Aware Training

4 Quantization in Pytorch

1 Objectives

2 Quantization : Basics

- Floating Point
- Integers, Fixed Point
- Quantization

3 Quantization : Neural Networks

- Quantization Post Training
- Quantization Aware Training

4 Quantization in Pytorch

Motivation

- 1 Reduce model size
 - Fewer bits → Reduced memory footprint
- 2 Decrease memory access
 - GPU & CPU : reduce Cache usage
- 3 Computational complexity

Table: Performance on the ImageNet dataset and complexities

Network	Alexnet	Inceptionv1	ResNet50	ResNet152
Top-5 error	16.4%	6.7%	5.25%	4.49%
Num. Weights	61M	7M	25.5M	63.75M
Num. MAC	724M	1.43G	3.9G	11.31G

Motivation

- 1 Reduce model size
 - Fewer bits → Reduced memory footprint
- 2 Decrease memory access
 - GPU & CPU : reduce Cache usage
- 3 Computational complexity

Motivation

- 1 Reduce model size
 - Fewer bits \rightarrow Reduced memory footprint
- 2 Decrease memory access
 - GPU & CPU : reduce Cache usage
- 3 Computational complexity

Motivation

- 1 Reduce model size
 - Fewer bits → Reduced memory footprint
- 2 Decrease memory access
 - GPU & CPU : reduce Cache usage
- 3 Computational complexity

Figure 7.1: The area and energy cost for additions and multiplications at different precision, and memory accesses in a 45 nm process. The area and energy scale different for multiplication and addition. The energy consumption of data movement (red) is significantly higher than arithmetic operations (blue). (Figure adapted from [121].)

Motivation

- 1 Reduce model size
 - Fewer bits → Reduced memory footprint
- 2 Decrease memory access
 - GPU & CPU : reduce Cache usage
- 3 Computational complexity

1 Objectives

2 Quantization : Basics

- Floating Point
- Integers, Fixed Point
- Quantization

3 Quantization : Neural Networks

- Quantization Post Training
- Quantization Aware Training

4 Quantization in Pytorch

Floating Point

Floating Point

Floating Point

Floating Point

■ To add two FP numbers:

- Shift M according to E (int shift n_E bits)
- Add M (int add n_M bits)
- Normalize ($0 < M < 1$)

■ To multiply two FP numbers:

- Multiply M (int mult n_M bits)
- Add E (int mult n_E bits)
- Normalize ($0 < M < 1$)

Integers, fixed point

- Fixed point ($-i$)
- Short range
- Simple computation

Uniform and Non-Uniform Quantization

- Uniform quantization enables the use of integer on fixed-point hardware
- Non-uniform quantization requires a codebook lookup → not straightforward for standard hardware (CPU, GPU)

Affine and Scale Quantization

(a) Affine quantization

(b) Scale quantization

- 2 kinds of uniform quantization
- Assymetric vs Symmetric

Wu, Hao, et al. "Integer quantization for deep learning inference: Principles and empirical evaluation." arXiv preprint arXiv:2004.09602 (2020).

Scale Quantization

$$\text{clip}(x, l, u) = \begin{cases} l, & x < l \\ x, & l \leq x \leq u \\ u, & x > u \end{cases}$$

$$s = \frac{2^{b-1} - 1}{\alpha}$$

$$x_q = \text{quantize}(x, b, s) = \text{clip}(\text{round}(s \cdot x), -2^{b-1} + 1, 2^{b-1} - 1)$$

$$\hat{x} = \text{dequantize}(x_q, s) = \frac{1}{s} x_q$$

$$y_{ij} = \sum_{k=1}^p x_{ik} \cdot w_{kj} \approx$$

$$\sum_{k=1}^p \text{dequantize}(x_{q,ik}, s_{q,ik}) \cdot \text{dequantize}(w_{q,kj}, s_{w,kj}) =$$

$$\sum_{k=1}^p \frac{1}{s_{x,ik}} x_{q,ik} \cdot \frac{1}{s_{w,kj}} w_{q,kj}$$

And, in order to use integer multiplication, the scaling factor s must be independent of k :

$$\frac{1}{s_{x,i} \cdot s_{w,j}} \sum_{k=1}^p x_{q,ik} \cdot w_{q,kj}$$

4 Quantization in Pytorch

Estimating the impact of quantization

Impact on weights

Signal-to-Quantization Noise Ratio metric.

W_k : weight number index k in the set.

\hat{W}_k : quantized weight index k in the set.

L : number of element in the set.

$$\text{SQNR}(\hat{W}) = \frac{\sum_{k=0}^{L-1} |W_k|^2}{\sum_{k=0}^{L-1} \underbrace{|W_k - \hat{W}_k|^2}_{\text{quantization error}}}$$

Generally expressed in dB: $\text{SQNR}_{\text{dB}} = 10\log_{10}(\text{SQNR})$

Impact on network performance

Directly measure the accuracy of the network. For instance: Top-1 or Top-5 errors.

Quantization Post Training : Weights

Start by considering weights with a few number of bits n .

Quantize → measure accuracy → increase the number of bits and repeat.

Different weight sets can be considered

- Whole network,
- per layer,
- per neuron.

Finer sets segmentation → better accuracy.

Depends on how weights are stored in hardware (parallel accesses).

Quantization Post Training : Activation

Start by considering **activations** with a few number of bits n .
Quantize → measure accuracy → increase the number of bits and repeat.

Also different strategies

- Whole network,
- per layer,
- per neuron.

Finer sets segmentation → better accuracy.
Depends on how **activations** are stored (parallel accesses).

Quantization Aware Training

- Quantize Forward
- Quantize Backward & Forward
- Weights
- Weights & Activations

Quantization Aware Training

- Quantize Forward
 - Quantize Backward & Forward
 - Weights
 - Weights & Activations
-
- Quantization Aware Techniques yield way better accuracy
 - Especially for extremely low-bit precision (2-3-4 bit precision)

Learned Step Size Quantization

- s quantizer step size
- Q_P and Q_N , the number of positive and negative quantization levels

$$\bar{v} = \lfloor \text{clip}(v/s, -Q_N, Q_P) \rfloor, \quad (1)$$

$$\hat{v} = \bar{v} \times s. \quad (2)$$

- s is learned with :

$$\frac{\partial \hat{v}}{\partial s} = \begin{cases} -v/s + \lfloor v/s \rfloor & \text{if } -Q_N < v/s < Q_P \\ -Q_N & \text{if } v/s \leq -Q_N \\ Q_P & \text{if } v/s \geq Q_P \end{cases} \quad (3)$$

Quantization while Learning - Binary Connect

Algorithm 1 SGD training with BinaryConnect. C is the cost function for minibatch and the functions $\text{binarize}(w)$ and $\text{clip}(w)$ specify how to binarize and clip weights. L is the number of layers.

Require: a minibatch of (inputs, targets), previous parameters w_{t-1} (weights) and b_{t-1} (biases), and learning rate η .

Ensure: updated parameters w_t and b_t .

1. Forward propagation:

$$w_b \leftarrow \text{binarize}(w_{t-1})$$

For $k = 1$ to L , compute a_k knowing a_{k-1} , w_b and b_{t-1}

2. Backward propagation:

Initialize output layer's activations gradient $\frac{\partial C}{\partial a_L}$

For $k = L$ to 2, compute $\frac{\partial C}{\partial a_{k-1}}$ knowing $\frac{\partial C}{\partial a_k}$ and w_b

3. Parameter update:

Compute $\frac{\partial C}{\partial w_b}$ and $\frac{\partial C}{\partial b_{t-1}}$ knowing $\frac{\partial C}{\partial a_k}$ and a_{k-1}

$$w_t \leftarrow \text{clip}(w_{t-1} - \eta \frac{\partial C}{\partial w_b})$$

$$b_t \leftarrow b_{t-1} - \eta \frac{\partial C}{\partial b_{t-1}}$$

Quantization while Learning - Binary Connect

1. Forward propagation:

$w_b \leftarrow \text{binarize}(w_{t-1})$

For $k = 1$ to L , compute a_k knowing a_{k-1} , w_b and b_{t-1}

Quantization while Learning - Binary Connect

1. Forward propagation:

$$w_b \leftarrow \text{binarize}(w_{t-1})$$

$$w^b = \begin{cases} +1, & \text{if } w \geq 0 \\ -1, & \text{otherwise} \end{cases}$$

Quantization while Learning - Binary Connect

1. Forward propagation:

$w_b \leftarrow \text{binarize}(w_{t-1})$

For $k = 1$ to L , compute a_k knowing a_{k-1} , w_b and b_{t-1}

Quantization while Learning - Binary Connect

2. Backward propagation:

Initialize output layer's activations gradient $\frac{\partial C}{\partial a_L}$

For $k = L$ to 2, compute $\frac{\partial C}{\partial a_{k-1}}$ knowing $\frac{\partial C}{\partial a_k}$ and w_b

Quantization while Learning - Binary Connect

3. Parameter update:

Compute $\frac{\partial C}{\partial w_b}$ and $\frac{\partial C}{\partial b_{t-1}}$ knowing $\frac{\partial C}{\partial a_k}$ and a_{k-1}

$$w_t \leftarrow \text{clip}(w_{t-1} - \eta \frac{\partial C}{\partial w_b})$$

$$b_t \leftarrow b_{t-1} - \eta \frac{\partial C}{\partial b_{t-1}}$$

Binarization : Stochastic vs Deterministic

■ Deterministic

$$w_b = \begin{cases} +1, & \text{if } w \geq 0 \\ -1, & \text{otherwise} \end{cases}$$

■ Stochastic

$$w_b = \begin{cases} +1, & \text{with probability } p = \sigma(w) \\ -1, & \text{with probability } 1 - p \end{cases}$$

avec

$$\sigma(x) = \text{clip}\left(\frac{x+1}{2}, 0, 1\right) = \max\left(0, \min\left(1, \frac{x+1}{2}\right)\right)$$

Binarization : Stochastic vs Deterministic

■ Deterministic

$$w_b = \begin{cases} +1, & \text{if } w \geq 0 \\ -1, & \text{otherwise} \end{cases}$$

■ Stochastic

$$w_b = \begin{cases} +1, & \text{with probability } p = \sigma(w) \\ -1, & \text{with probability } 1 - p \end{cases}$$

avec

$$\sigma(x) = \text{clip}\left(\frac{x+1}{2}, 0, 1\right) = \max\left(0, \min\left(1, \frac{x+1}{2}\right)\right)$$

Quantization while Learning - Binary Weighted network (XNOR-NET)
